# Physics-Informed Neural Networks for Multiphysics Simulations:

Application to Coupled Electromagnetic-Thermal Modeling

**Shutong Qi and Costas Sarris** 

#### **Outline**

- Background and motivation
- Review of electromagnetic-thermal simulations
- Physics-informed neural networks for electromagnetic-thermal simulations
- Numerical Results
- Conclusions

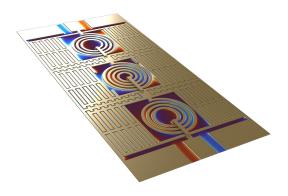

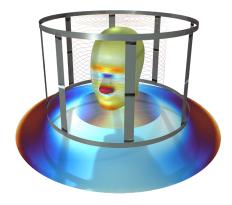

## Challenges of multi-physics simulation

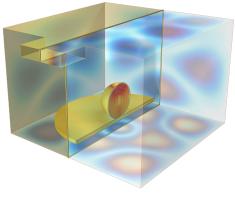

- Involving heterogeneous models
- Requiring significant computational resources
- Problems from data transfer and synchronization
- Error propagation between coupled numerical techniques

EM, thermal, and structural analysis of the microstrip

The electric field around an air phantom inside of a birdcage coil

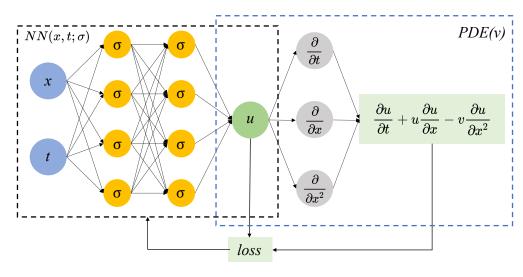

Heat transfer simulations in an microwave oven

## **Physics-Informed Neural Networks**

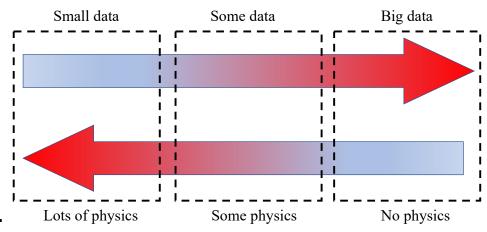

PINN algorithm

G. E. Karniadakis, I. G. Kevrekidis, L. Lu, P. Perdikaris, S. Wang, and L. Yang, "Physics-informed machine learning," Nature Reviews Physics, vol. 3, no. 6, pp. 422–440, 2021.

#### Key points of state-of-the-art PINN

- Unsupervised training
- Computational efficiency
- Better generalization ability
- Real-world applications

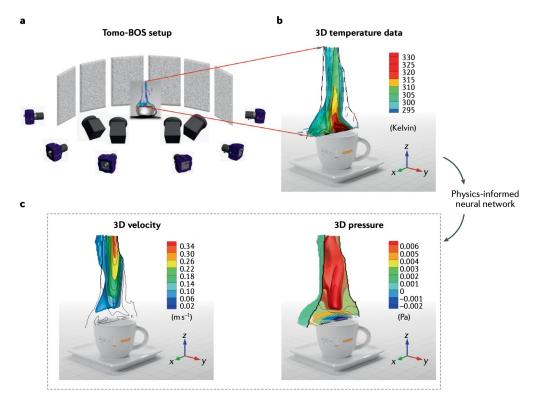

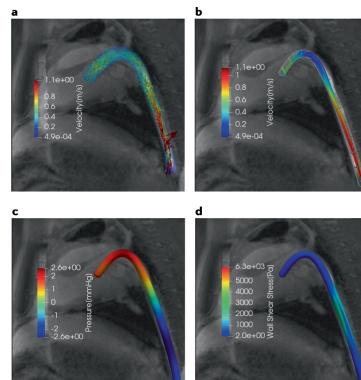

## **Physics-Informed Neural Networks**

Inferring the 3D temperature, velocity, and pressure flow over an espresso cup with PINN.

Physics-informed filtering of in-vivo 4D-flow magnetic resonance imaging data of blood flow in a porcine descending aorta.

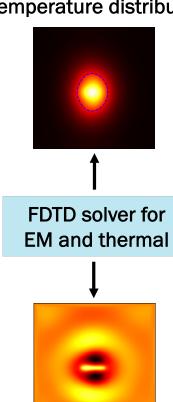

### **Electromagnetic-thermal analysis**

#### Temperature distribution

Coupled electromagnetic-thermal problems can be analyzed by numerical solvers, such as FEM and FDTD. However, there are several questions to be addressed:

- Complex mathematical models and enormous computing resources requirement
- Error propagation between coupled multiphysics numerical solvers
- Appropriate spatial discretization for different solvers

Therefore, we combine the robust/well-understood FDTD solver for the electromagnetic simulation with a neural network for the thermal simulation.

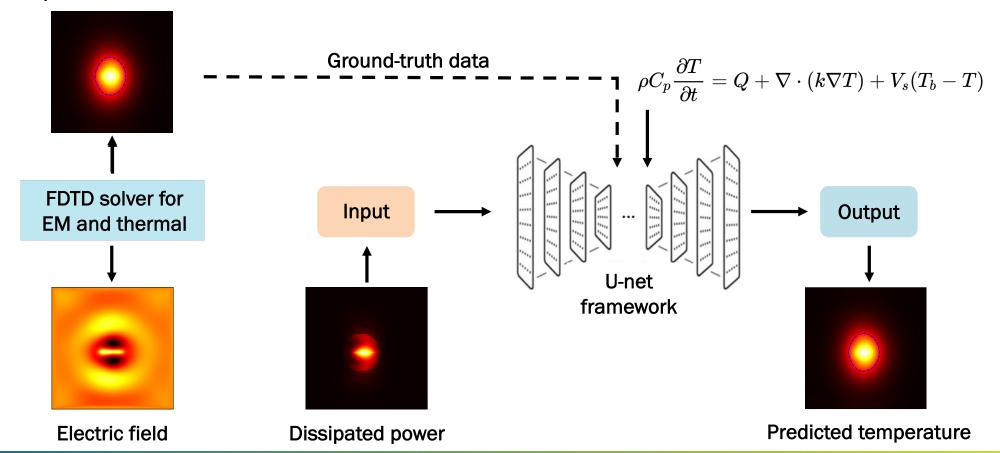

## Electromagnetic-thermal analysis

#### Temperature distribution

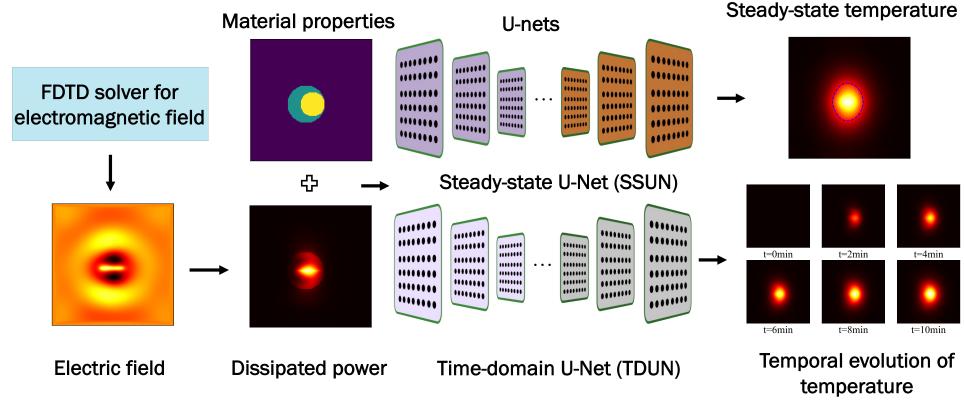

Goal: Replace the numerical thermal solver in electromagnetic-thermal simulations with physics-informed neural networks.

Key points: Implement the heat equation and boundary conditions into the neural networks to enable the unsupervised training.

Heat equation: 
$$ho C_p rac{\partial T}{\partial t} = Q + 
abla \cdot (k 
abla T) + V_s (T_b - T)$$

Approximate the partial derivative of the temperature with respect to time with forward finite difference:

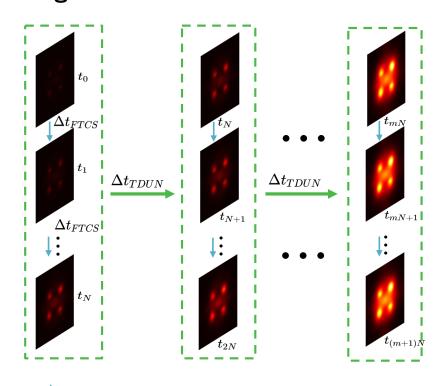

$$T^{n+1}-T^n-rac{\Delta t_{div}}{
ho C_p}ig(Q+k
abla^2T^n+V_s(T_b-T^n)ig)=0$$

For *N* successive steps:

$$\sum_{i=n}^{n+N-1} \left(T^{i+1}-T^i-rac{\Delta t_{div}}{
ho C_p}ig(Q+(k
abla^2T^i)+V_s(T_b-T^i)ig)
ight)=0.$$

Then, the loss function of the TDUN becomes:

$$L_{TDUN} = \sum_{i=n}^{n+N-1} \left| T^i - T^{i+1} + rac{\Delta t_{div}}{
ho C_p} ig(Q + (k
abla^2 T^i) + V_s (T_b - T^i) ig) 
ight|^2$$

**Update of FTCS** 

Update of TDUN

Key points: Implement the heat equation and boundary conditions into the neural networks to enable the unsupervised training.

Heat equation: 
$$ho C_p rac{\partial T}{\partial t} = Q + 
abla \cdot (k 
abla T) + V_s (T_b - T)$$

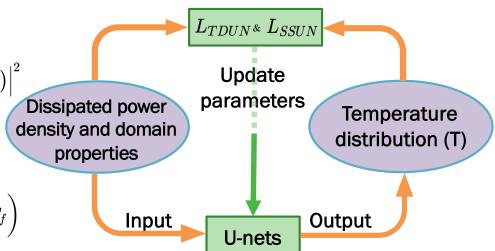

Loss function:

$$L_{TDUN} = \sum_{i=n}^{n+N-1} \left| T^i - T^{i+1} + rac{\Delta t_{div}}{
ho C_p} ig(Q + (k
abla^2 T^i) + V_s (T_b - T^i)ig) 
ight|^2$$

Robin boundary condition:  $-k \left( \frac{\partial T}{\partial \mathbf{n}} \right) = h(T_w - T_f)$ 

In a discretized form:  $-kigg(rac{T_{i,j}-T_{i-1,j}}{\Delta x}igg)=higg(rac{T_{i,j}+T_{i-1,j}}{2}-T_figg)$ 

Each element at the boundary:  $T_{i,j}=rac{(2k-h\Delta x)T_{i-1,j}+2h\Delta xT_f}{2k+h\Delta x}$ 

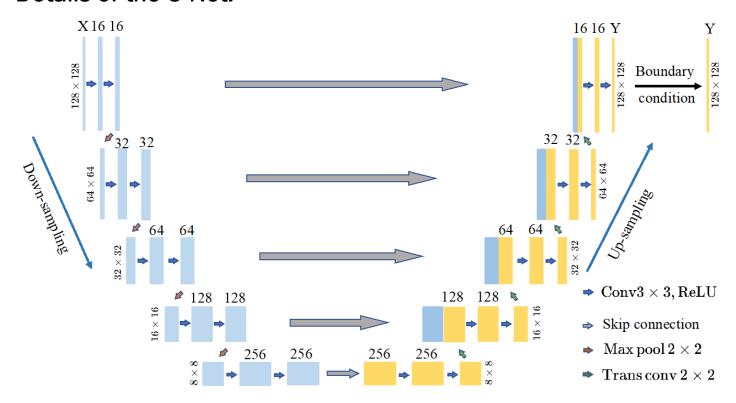

#### **Details of the U-Net:**

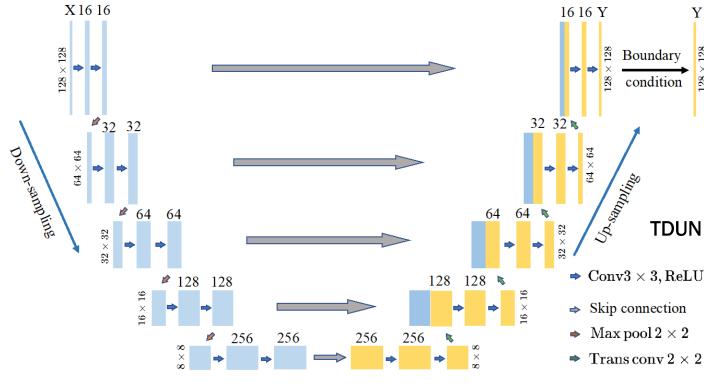

#### **Details of the U-Net:**

T<sup>0</sup>: initial temperature distribution (K)

Q: dissipated power density (W/ $m^3$ )

k: heat conductivity (W/m/K)

 $C_p$ : heat capacity (J/kg/K)

 $\rho$ : material density (kg/m<sup>3</sup>)

TDUN output:

**TDUN input:** 

 $\{T_{i,j}\}^{n=1,2,...,N}$ : N successive steps of temperature (K)

TABLE I ELECTRICAL PROPERTIES OF MATERIALS IN THE SIMULATION AT 2 GHZ

	Relative	Relative	Electrical
	Permittivity	Permeability	Conductivity
	$arepsilon_r$	$\mu_r$	σ(S/m)
Breast tissue	$8.163 \pm 0.577$	1	$0.497 \pm 0.069$
Benign Tumor	$21.664 \pm 1.559$	1	$0.955\pm0.122$
Cancer	$63.008 \pm 2.108$	1	$4.164 \pm 0.074$

TABLE II
THERMAL PROPERTIES OF MATERIALS IN THE SIMULATION

	Thermal Conductivity k(W/m/K)	Heat Capacity $C_p(\mathrm{J/kg/K})$	Density $ ho({ m kg/m^3})$
Breast	0.500	3770	$1000 \pm 100$
Benign Tumor	0.580±0.02	3600±200	1000±100
Cancer	0.580±0.02	3600±200	1000±100
Blood		3622.5	1000±100

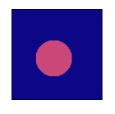

## Numerical experiments – building database

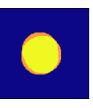

#### Training cases

Heat transfer coefficient:  $h=5\mathrm{W/m^2/K}$ 

$$ho C_p rac{\partial T}{\partial t} = Q + 
abla \cdot (k 
abla T) + V_s (T_b - T)$$

Eliminate the temperature of flowing blood:

$$T^{'}=T-T_{b}$$

$$ho C_p rac{\partial T^{'}}{\partial t} = Q + k 
abla^2 T^{'} - W_b C_b T^{'}$$

Both training data and testing data include benign and malignant tumors. The induced temperature should be in excess of 323.15 K (50°C) to ablate tumor cells. The Relative error:  $\mathcal{E}_{rel} = \frac{1}{128^2} \sum_{i=1}^{128} \sum_{i=1}^{128} \frac{|T_p(i,j) - T_r(i,j)|}{T_r(i,j) - 310}$ source amplitude is set to 300 V/m for benign tumors and 100 V/m for malignant tumors.

Relative error: 
$$\mathcal{E}_{rel} = rac{1}{128^2} \sum_{i=1}^{128} \sum_{j=1}^{128} rac{|T_p(i,j) - T_r(i,j)|}{T_r(i,j) - 310}$$

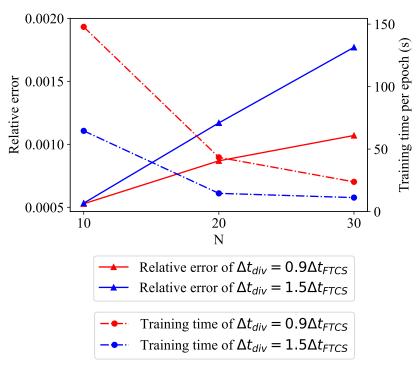

## Numerical experiments – study of hyperparameters

#### Choice of N and $\Delta t_{div}$

 $\Delta t_{FTCS}$ : largest time step allowed by the stability limit

N: the number of steps in each batch of TDUN

 $\Delta t_{div}$ : the time step within each batch

 $\Delta t_{TDUN} = N \times \Delta t_{div}$ : effective time step

Update of FTCS

→ Update of TDUN

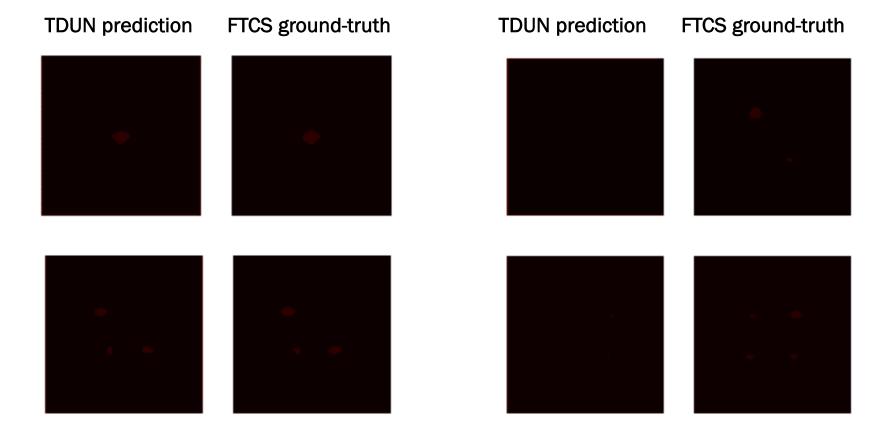

# Numerical experiments - Results

### Numerical experiments - Discussion

Efficiency: compare training time and execution time on an intel-I5 CPU, and Nvidia GTX 3090 GPU

The time step of the TDUN is not limited by the stability condition of finite-difference method, in this work,  $\Delta t_{TDUN} = 1.5 \Delta t_{FTCS}$ .

TABLE III
COMPARISON OF EXECUTION TIME OF FTCS AND TDUN

	FTCS (s/case)	TDUN (s/case)
Intel-i5 CPU	22.74	4.34
NVidia GTX 3090 GPU	1	1.28

#### Generalization ability:

Both the SSUN and TDUN is trained based on the embedded heat equation.

They generalize well to:

- Shape of objects
- Number of objects
- Amplitude of the source
- Material properties

#### Conclusion

- Physics-informed U-nets to replace the thermal solvers
- The network is trained in an unsupervised approach, no ground-truth data needed
- Coupled numerical method with neural networks for multiphysics modeling
- Numerical results demonstrate the accuracy, efficiency and generalization ability of the proposed approach

#### **Future work**

- PINN for EM simulation: test & evaluation
- PINN-based 3-D time-domain EM-thermal solver

# Thank you!
