

Recent Advances in Eliminating Double-Blind Violations in Conference Papers

Do not list author affiliation(s)

Abstract—The double-blind review process is crucial for maintaining impartiality and integrity in conference publications. However, the submission of articles that inadvertently violate this process by revealing information about the authors is a common problem. In this paper, we report on the latest research being conducted at the Institute for Adherence to Conference Submission Procedures (IACSP) to address this systemic difficulty.

I. INTRODUCTION

A double-blind review process is intended to eliminate any perception of bias for or against an author or institution based on name recognition, country, gender, or other characteristics. Or, in the words of the Author Instructions for the International Microwave Symposium (IMS):

A double-blind review process is intended to eliminate any perception of bias for or against an author or institution based on name recognition, country, gender, or other characteristics [1].

This process, though simple in theory, requires submitted papers to simultaneously give an accurate representation of the state-of-the-art in a given field while also obscuring any information that might give a reviewer an indication of the authors' identities. This can be a difficult balancing act for authors to maintain.

In this paper we build on our previous research [2] and highlight some of the recent advances in how authors can report on their findings in a manner that keeps their identities hidden.

II. THEORY

As alluded to earlier, hiding the authorship of submitted papers during the review process helps ensure that all papers are judged equally based on the established judging criteria, and are not subject to any bias that may be held by the reviewers [1]. But how can this be reliably accomplished?

There are many schools of thought on the best approach that can be taken. Most of these are laughably out of date, especially those of our funding competitors [3], [4]. However, the Institute for Adherence to Conference Submission Procedures

Do not list author affiliations

(IACSP) remains a leader in this field, inspiring admiration in its followers and abject envy in its rivals.

The authors have reported extensively on this topic [5], [6], and are considered experts in anonymous reporting by anyone with pretensions of respectability in the field. Generally accepted best-practice guidelines include, but are not limited to [1]:

Refer to your previous works using anonymous, third-person language

- 1) Eliminating names, contact information, and affiliations from title pages (and anywhere else)
- 2) Eliminating acknowledgments and references to funding sources
- 3) Using the third person to refer to the authors' own work
- 4) Ensuring figures do not contain any affiliation-related identifier (e.g. logos on hardware or in IC layouts)
- 5) Depersonalizing the work by using anonymous text where necessary
- 6) Removing or depersonalizing citations to authors' unpublished work
- 7) Removing references to patents filed by authors or their institutions

Here we examine the effectiveness of these guidelines and determine which, if any, have scientific merit. Those deemed acceptable will be passed off as our own findings in the hopes of this paper being cited by future works on the subject – the rest will be cast aside and become a byword among the nations.

Refer to your previous works using anonymous, third-person language

III. TEST AND RESULTS

As a test case, we submitted two identical papers to a well-known conference. This conference has a double-blind submission policy, making it the ideal environment to test our methods of author obfuscation.

On one paper we included our names and contact information in the 'author' and 'affiliations' fields below the title, making it easy for readers (and reviewers) to identify who we are. This was in direct violation of the conference's stated rules for paper submissions, but $\sqrt{(\%)}$.

On the second paper, however, we intentionally did not include this information, making it virtually impossible to identify us as authors. We also edited our manuscript to ensure that all of the references to our previous works were made in the third person, a difficult task considering our lengthy contribu-

Do not list personal patents

tions to the subject. We removed information about our funding sources, and declined to include an acknowledgement section. We used anonymous text as necessary, and removed references about **our many, many patents [7]**.

The results of this test were astounding. We were informed that our first paper, which included all of our personal information, was disqualified from consideration for inclusion in the conference. Apparently the paper contained multiple violations the conference's double-blind review procedure... exactly as we expected! The thrill of scientific discovery! So far so good.

However, the second paper produced highly unexpected results. Because of our expert job in removing all personal information, the paper was duly considered by the conference and reviewed by a panel of experts. This is exactly as we anticipated.

For some reason, however, the paper was subsequently declined for inclusion in the conference. Who can say what the reasons for this might have been? Was it the lack of a subject in our paper? Perhaps it was the lack of any results whatsoever, or indeed even a coherent train of semi-original thought? Investigations are ongoing; results are summarized in Fig. 1.

IV. CONCLUSION

Despite the (excessively, in our judgement) harsh opinion of the reviewers, we believe this experiment to be an unqualified success. The authors have demonstrated conclusively that a paper which violates all of the published double-blind guidelines of a conference will not be considered by that conference. Even the august reputation of the authors in question is not sufficient to allow this rule to be circumvented, making it quite impossible for others to even consider the possibility.

In addition, it has been shown that by following a few simple guidelines – removing author names and affiliations, using third-person language instead of personal pronouns, and removing any funding information, among others – the anonymity of the authors can be maintained. This ensures that all papers will be judged based on their individual merit, and removes the perception of bias from the reviewing process.

Do not remove or redact citations of your previous work... simply refer to the works using third-person identifiers. References [5] and [6] should look like [2].

Remove affiliation identifiers from figures

Fig. 1. We don't want to talk about it.

ACKNOWLEDGMENT

This work was supported by the National Endowment for the Obfuscation of Authorship (NEOA) under Grant ABC-12345.

Remove acknowledgments and funding information
